

Forceps : Decision Making and Technique

Professor Olivier Dupuis 01 10 2016

Lyon University

I. Instrumental Vaginal Delivery Epidemiology ?

EUROPE 2010

Romania 0,5%, Italy 3,4%; France 12,1%, Ireland 16,4%

Median rate = 7,5% of births

U.S.A 2013

3,3 % of all deliveries (Same as Italy, one third of France)

Ref ACOG Practice Bulletin Number 154 November 2015 Large Difference Worlwide But is there any statistical association between Rates of CS And Rates of Instrumental vaginal delivery?

EUROPE 2010

Figure 1. Comparison between caesarean section and vaginal instrumental birth rates, 2010.

26 States of the European Union, No Relation !!

MacFarlane AJ et al BJOG 2015

U.S.A 2015

« According to a newly revised Practice Bulletin Operative vaginal deliveryshould be used to safely avoid cesarean delivery »

ACOG, October 21, 2015

Operative Vaginal Delivery rate evolution ?

Fig. 1. The annual rate of operative vaginal delivery expressed as a percentage of total deliveries for the study period 1991–2010.

Fig. 2. The annual rate of cesarean delivery expressed as a percentage of total deliveries for the study period 1991–2010.

Hehir MP et al EJOG 2013; 171:40-3 National Maternity Hospital Dublin

National Maternity Hospital, Dublin

- During the 20 years 11,4% of total Births and 13,6% of vaginal deliveries are OVD
- Nulli para Increase From 14,2% in 1991-5 to 23,4 % in 2006-10
- Multi para Increase From 2,6% in 1991-5 to 5,1% in 2006-10
- Operative Vaginal Delivery increase 0,42 % each year
- During the same Time CS Rate Increase

An association between Rates of CS And Rate of Instrumental vaginal delivery Is not Demonstrated

Effect of the Maternity Type on Operative Vaginal Rate ?

Data from France 2010 , Low Risk woman

Level I , IIA, IIB , III

Public VS Private Practice

Significantly More OVD in Private Public : 13,4% rate Private : 19,7 % rate p<0,001

No significant Difference

Unit Size <1000 VS > 3000 d/y

Significantly More OVD in Maternity with > 3000 deliveries OR: 1,47 (95% CI 1,10-1,96)

Coulm B et al Birth 2012:3:183

Explanation for Private practice Increase in OVD ?

- Higher Fear of litigation in case of FHR abnormalities ?
- **ObGYn more sensitive to women's requests ?**
- Allow easier Time managment ?

No direct link with financial incentives. (In France Fees paid by the National Health Insurance is the same for F, V, CS or SVD)

Instrument Type Rate ?

	1991 - 1995	2006 - 2010
Forceps	68,2%	32,9%
Vacuum	31,8%	67,1%

In 2016, Vacuum Is the First Line Instrument

Ref : Hehir MP et al EJOG 2013; 171:40-43 National Maternity Hospital Dublin Is there any « Ideal Rate » of Instrumental vaginal, Spontaneous vaginal, or CS rate ?

What is a « Best Rate »?

► W.H.O Recommandation

Cesarean Section Optimal Rate ?

Yes

 « There is no justification for any region to have a rate higher than 10-15% » Lancet 1985; 2 (8452) 436-7
Outdated Recommandations 19%, in 2016

Jama, 2015

Operative Vaginal Delivery Optimal Rate ?

Not stated

R.C.O.G Recommandation

Green Top Guideline n°26 January 2011

Between 10 and 13% of Operative Vaginal Deliveries in U.K

Remained stable

What about Optimal OVD Rate ?

Not stated but « rate of OVD should be reviewed on a regular basis. »

A.C.O.G Recommandation

Practice Bulletin Summary, Number 154, November 2015

3,3% of all deliveries in 2013

What about Optimal OVD Rate ?

Not stated

Epidemiology Data Summary

- In 2016, Still a Significant number of delieveries with Forceps or Vacuum

- No clear Relation between CS Rate and Forceps and Vacuum Rate No recommended Rate ? = Of course ... the Type of Delivery should never ever be a Goal for an ObGYn

Our Only Goal is : A healthy Mother A healthy Neonate

Is CS before labor always a Safe Procedure ?

Neonatal Trauma

 We were surprised to find that fewer than half of the cases of brachial plexus injury identified in this study were seen in CS for dystocia and that four of the nine brachial plexus injury occured in women with CS who did not labor at all.

<u>Several types of fetal injury commonly associated with</u> <u>difficult vaginal delivery occured in women who did not labor</u> <u>and underwent an elective repeat cesarean delivery</u>. »

Alexander JM Obstet Gynecol 2006 108(4) ; 885-90 2006 (37 110 CS among them 12565 before labor)

Cesarean Section, Unpublished Case ...
Difficult delivery through Hysterotomy
Cervical Spine Trauma leading to
a Permanent Spastic Tetraplegia +++

Rhone-Alpes Région Medico legal Issue 7 Million Euros ..

Maternal Mortality

✤ 15 801 CS before Labor and 17 898 trial of labor

 Of the seven <u>maternal deaths</u> in the group that underwent elective repeated cesarean delivery, <u>two maternal death were</u> <u>considered attributable to the cesarean delivery</u> »

> Landon M N Engl J Med 2004;351:2581-9 19 maternity Hospitals USA 1999-2002

Never Let Our Patient Think That delivery with CS means No Risk

II. The Best Operative Vaginal Delivery Is the One that can be avoided.

> Can Operative Vaginal Delivery Be avoided ?

> > Evidence Based Data?

A. Does Continuous One to One Support decrease OVD ?

Cochrane Database 2007 Hodnett ED et al 19 trials RR 0,90; 95% CI (0,82-0,96) « Yes, it Can reduce the incidence of OVD »

Continuous support for women during childbirth (Review)

Look for significant studies : exclude all the studies in which the risk ratio Include the value « 1 » Breart 1992 Study No access to the paper, unclear reference

Among 19 studies only 2 with significant results :

- First study : Wrong reference ?

- Second study : John Kennell study Jefferson Davis Hospital, Tx « One to One group » 8,2% forceps rate versus 21,3% in the « observed group ». P<0,05

BUT....

« At this facility, companions were not routinely permitted to be with a woman during labor and delivery because most patients labored in a 12 bed ward that had insufficient privacy to allow visitors... »

2 Studies but

- From the early 1990 > 20 years
- In both sudies : « Discrepancy in the number of woman enrolled »

Cochrane Review « The trials were of generally goodquality »

I do not agree : Lack of Good studies , Lack of Clear evidence

No Clear Evidence of any effect of continuous One to One Support on Forceps or Vacuum Rate Do not Take Cochrane Review Conclusions For Granted ...

B. In woman with epidural in the second stage Does any specific Maternal position decrease OVD ?

At least 30% of time in the relevant phase of labor in the allocated position

Cochrane Database ?

2013, Emily Kemp et al

Rate of Operative deliveries = CS or Operative vaginal delivery are not Significantly different ++ 5 RCT ,874 woman

«At full dilatation if the woman has an epidural analgesia she can use whatever position she find confortable»

In cases with epidural analgesia No Clear Evidence of any effect of Maternal Positions on Forceps or Vacuum Rate C. In woman Without epidural analgesia and in the second stage does any specific Maternal positions decrease OVD ?

Cochrane Database ?

Bofill 1997	39/49	28/51		5.7%	1.45 [1.09, 1.93]

Epidural analgesia increase OVD, both vacuum And forceps deliveries

Avoiding Epidural Analgesia Significantly reduce the Rate of Forceps as well as the rate of Vacuum delivery (RR = 1,42 95% CI 1,28-1,57 ; 7935 woman) But ... EA offer a significantly better pain relief (3 trials, 1166 women)

In My Department 85% rate of epidural analgesia

E. At Full dilatation How Many Time can I Wait before Proceeding to An OVD ?

	Median*	95 th Percentile
Primipara	1,1 h (66 mn)	3,6 h (216 mn) Warning > 2 h X 6 Anal Sphincter Risk **
Multipara	0,4 h (24 mn)	2 hr (120 mn)

*Ref: Safe labor consortium group; Obstet Gynecol 2012; Nov
** Fitzgerald Obstet Gynecol 2007, 109;29 407 anal sphincter tear

We need study to Know whether Waiting until the 95th Percentile **Of time** decrease The Rate of Forceps **Or Vacuum AND whether** This Attitude is Safe ++ **Small number of US studies leading to new** recommandations but **Complications increase ...** (PPH...)

III. Is Forceps Better than Vacuum Which Instrument should I Use ?

Failure Rate ?

Significantly more failure with Vacuum OR 1,7; 95% CI 1,3- 2,2

Ref : Cochrane review , Johanson RB, 1999;2 Vacuum extraction VS forceps for assisted vaginal delivery

> High Failure Rate with Vacuum

Kiwi Omni Cup from 12,9 to 34%

Standard Cup 21%

Ref : Attilakos, G, BJOG 2005;112:1510-5 and Groom KM BJOG 2006;113:183-9 And Baskett TF J Obstet Gynaecol Can 2008;30:573

Maternal and Neonatal Morbidity

> Vacuum :

- -- Any reported Maternal Death ? Yes, from cervical tear
- -- Any reported Neonatal Death ? Yes, from Subgaleal Hemorrhage ++

> Forceps

- -- Any reported Maternal Death ? Yes, from uterine rupture undiagnosed
- -- Any reported Neonatal Death ? Yes, from Intracranial Hemorrhage

For Both Instruments the Obstetrician Need to follow the appropriate safety procedures

IV. Forceps and Vacuum Procedures ?

1. Pre Requisite : Training + Senior Supervision

No OVD before Training
 For Resident No OVD without Senior supervision

- Vacuum

No use before 36 weeks No use on Face presentation No use with significant caput

Training for Astronaut

Training for Pilot

YouTUbe « birth simulator insa » Training for ObGyn

« A 2 hour Birth Simulator training session that includes 30 practice Placements of forceps blades allows for significant improvement In obstetricians' skills »

Dupuis O et al EJOG 2011

2. Look for any of those 4 Contra indication :

A. Slow Labor ? Warning : Reaching Full Dilatation is not a Goal ! Look at the Partogram +++ I Use « the 8 Hours Rule » 8 Hours after the beginning of the active Phase (4cm),full dilatation should be achieve

B. Severe Molding ?

No OVD if cranial bone overlap

C. Large Caput ?

Never ever say : « I see the neonate hair, proceed to forceps or vacuum, the baby is Here » You should assess the skull and not the skin position ++++

Never ever speak of « skin to fœtal head distance », speak of « skin to skull distance » D. Significant Maternal pain ? No OVD in case of Significant Pain Start by an efficient and safe Analgesia

3. Is there a Real Indication?

A. Is the bladder empty Distensione della vescica ?

"To relieve a full bladder is one of the great human joys."

-Henry Miller

Epidural analgesia
 No more bladder sensation
 Full bladder (300 ml or more)
 Lack of descent
 Forceps

This is a typical « Nocebo effect »

Empty the bladder and know How many ml was in the bladder ? More than 150 ml explain a lack of descent B. If FHR is normal, did you allow enough
Time for descent ?
If elapsed time since full dilatation is
less than 2 hours : Relax and Wait +++

C. If FHR is normal and its an OP Proceed to manual rotation if the mother OK

D. If FHR is abnormal look for an etiological treatment Stop Ocytocin if > 5CU/10 mn 4. Make Sure you Have a Spatial Image of the fœtus position and that you master the « theory of symmetry »

- Station?
- Position?
- Instrument application ?

What is my « Theory of symmetry » The Egg theory ?

Professor Olivier Dupuis PhD Thesis Available online at « Apport du forceps instrumenté » Dupuis O, 236 pages

Theory of Symmetry

«A small force applied asymmetrically could be more dangerous than a great deal of force applied symmetrically »

During a delivery DO NOT ONLY FOCUS ON THE QUANTITY OF MECHANICAL FORCES Rather FOCUS ON QUALITY OF MECHANICAL FORCES **During Every Delivery The Best Forces are**

Forces as small as possible Forces as symmetrical as possible

Synchronisation between Uterine Contractions Pushing effort and Traction

Good pain relief

Mother cooperation or GA

Quality control of ID application

Ref : Mises à jour en Gynécologie et Obstétrique et techniques Chirurgicales CNGOF 2013 Editions VIGOT Paris Simulation et extraction instrumentale. La théorie de la symétrie. Olivier Dupuis 2013 Pages 437-443

Ref : Lapeer R, Audinis V, Gerikhanov Z, Dupuis O. A computer based simulation of obstetric forceps Placement Med Image Comput Comput Assist Interv 2014, 17(Pt 2):57-64.

How did I get to this theory ?

American Journal of Obstetrics and Gynecology (2005) 192, 165-70

Comparison of "instrument-associated" and "spontaneous" obstetric depressed skull fractures in a cohort of 68 neonates

Theory of Symmetry

« A small force applied asymmetrically could be more dangerous than a great deal of force applied symmetrically »

During a delivery which reasons can lead to asymmetrical forces ?

> What are the « ischial spines » ?

Station	Definition	Delivery	
- 5 - 4 - 3 - 2 - 1	« HIGH »	« C section »	
0 +1	« MID »	Potentially Dangerous Only Senior MD « Discuss a CS »	
+2 +3 +4 +5	« LOW » « OUTLET »	« Vaginal Operative Delivery »	

 Rate of engagement errors : 12 % (IC 95%; 8.6 – 16) (resident)
 12 % IC 95%; 8.1 – 15) (attending physician)
 Accuracy of clinical estimation of fœtal head station is not optimal

Choosing not to perform « Mid » instrumental deliveries could decrease the number of potentially dangerous situations...

 News tools are needed to help physicians estimate fœtal station
 Transperineal Ultrasound ++++

B. Question n°2 Foetal head Position ?

No mistake

ELSEVIER

European Journal of Obstetrics & Gynecology and Reproductive Biology 123 (2005) 193-197

Fetal head position during the second stage of labor: Comparison of digital vaginal examination and transabdominal ultrasonographic examination

Olivier Dupuis ^{a,*}, Silveira Ruimark ^b, Dupont Corinne ^c, Thevenet Simone ^d, Dittmar André ^b, Rudigoz René-Charles ^a

⁴Unité de Gynècologie Obstétrique, Hôpital de la Croix Rousse, 103 Grande-Rue de la Croix Rousse, 69317 Lyon Cedex 04, France ^b Laboratoire de Physique de la matière, Bâtiment Blaise Pascal, INSA, 7 Avenue Jean Capelle, 69621 Villeurbanne Cedex, France

Table 3

Mistake : Estimated Positon ≠ Real Position

Second reason of asymmetry

Relationship between head location and digital vaginal examination error

Head location	Range of error		Total
	0-45°	>45°	
Occiput anterior (OA, ROA, LOA)	78	12*	90
Occiput posterior (OP, ROP, LOP) and	10	10 [*]	20
Total	88	22	110

* Difference in error rate between the occiput anterior and the occiput posterior + occiput transverse group is highly significant: p < 0.001.

In OP position as much as 50% of errors

Accuracy of clinical estimation of fœtal head Station is not optimal

 \triangleright

- Transabdominal ultrasonography is a simple, quick and efficient way of increasing the accuracy of fetal head position
 - Ultrasound identification of the fœtal head position might
 Increase the success rate and safety of instrumental delivery

OA position ROA position LOA position

OP position

LOP position

Use abdominal Utrasonography

Or

The « Two fontanel sign » Once you have one fontanel Look for the second one 9,5cm ahead*

*O Dupuis et al 2016 J Gynecol Obstet Biol Reprod 2016 Feb 10 epub ahead of print

Sylvie Bin-Dorel^b, Xavier Brun^c, Michel Berland^a, Tanneguy Redarce^c

Computer driven analysis of the forceps blade trajectories Has shown that you need to master the forceps to put it in a LOA, ROA, ROP or LOP position

Forceps and Vacuum should be applied Symmetrically on the foetal head +++

Oblique Position (LOA, ROA, LOP, ROP)

Symmetric application of the instrument requires a symmetric movement from the obstetrician Symmetric application of the instrument requires an asymmetrical movement from the obstetrician

5. Classify the OVD using the 3 Color Code

Available online at www.sciencedirect.com

Red, orange and green Caesarean sections: A new communication tool for on-call obstetricians

Olivier Dupuis^{a,*}, Isabelle Sayegh^b, Evelyne Decullier^{c,d}, Corinne Dupont^f, Henri-Jacques Clément^e, Michel Berland^a, René-Charles Rudigoz^b

What are the conclusions of Faro, Windle and Ranck studies ?

EXPERIMENTAL NEUROLOGY 1, 130-154 (1959)

Brain Damage in the Monkey, Macaca mulatta, by Asphyxia Neonatorum

JAMES B. RANCK, JR. AND WILLIAM F. WINDLE¹

Laboratory of Neuroanatomical Sciences, National Institute of Neurological Diseases and Blindness, National Institutes of Health, Public Health Service, U.S. Department of Health, Education and Welfare; and Department of Anatomy, School of Medicine, University of Puerto Rico

Received January 12, 1959

Asphyxia length of time	Brain histologic lesions ?
< 8 mn	None
8 – 11 mn	Minor
11 – 17 mn	Major

Red Code First Line : Use Forceps or CS Second Line : Cesarean Section Try to avoid Forceps Trial Proceed to Forceps only if you think that Failure will not happen or perform a CS...

Exemple : bradycardia without recovery

Orange Code First line : Use Forceps or Vacuum Second Line : Vacuum or CS Ex : pathological CTG without bradycardia **Green Code** First Line : Vacuum (≤3) Second Line : Forceps (\leq 3) **Third Line : CS**

6. Apply the instrument and check its symmetry

7. Traction:

Always synchronise your pull with Uterine Contraction and with Bearing effort

Get the appropriate axis of traction
 -- Vertical axis in case of OA
 -- « Enroulement » or Rotation in case of OP

Never ever > 3 pull If there is no evidence of progressive descent 8. Expect Shoulder Dystocia

Ask the woman Not to push = Open the mouth,

Pushing for shoulders = Dystocia

Pushing for shoulders = Anal Sphincter Injury

Shoulder Dystocia risk if Forceps or Vacuum	Weight (g)
12,2%	4000-4250
16,7%	4250-4500
27,3%	4500-4750
34,8%	>4750

Nesbitt TS AJOG 1998 179:476

CONCLUSION

« I. Team Work is mandatory »

« II. A fœtus is a deep sea diver »

....He is il Fragile ... , in case of Bradycardia, or pathological FHR length of time Matter »

Never ever make more than 3 pull if there is no evidence of progressive descent

« Each Time you Can Make invisible thing Visible, Make it visible » « I do not want a good or an old professionnal, I want a professional That Understand and Respect Procedures »

Grazie Per L'Attenzione

What does « Station » mean ?

Pressure = Force / Surface

Asymmetrical force application leads to decrease surface between the instrument and the neonate skull hence increase pressure on the fœtal head , hence might be related to associated brain lesions

Total Forces = Normal Forces + Shearing Forces

Asymmetrical force application leads to Shearing Forces Hence Tearing of cerebral veins, hence intracranial hemorrhage

\succ The theory of symmetry needs to be kept in mind

Theory of Symmetry

« A small force applied asymmetrically could be more dangerous than a great deal of force applied symmetrically »

> Quality ie Symmetry of forces is very important Do not only focus on Quantity Focus on Quality

Neonatal Trauma

- ✤ 12 565 CS before labor among 37 110 CS (1999 and 2000)
- ♦ 418 Neonate Trauma = 1,13% (418 / 37 110)
- 4% = skin abrasion
- Higher Risk of Neonatal Trauma if Failure of OVD or if Skin to Delivery interval < 3 mn</p>

James M Alexander et al Fetal Injury Associated with cesarean delivery Obstet Gynecol 2006;108:885-90 13 maternity hospitals in USA
